

**Daffodil International University**  
**Faculty of Science & Information Technology**  
**Department of Computing and Information System**  
**Final Examination, Summer-2026**  
**Course Code: CIS235, Course Title: Software Engineering**  
**Level: 2 Term: 3**

**Exam Duration: 2 Hours**

**Marks: 40**

**Answer ALL Questions**

*[The figures in the right margin indicate the full marks and corresponding course outcomes. All portions of each question must be answered sequentially.]*

|    |    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |               |      |
|----|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------|
| 1. | a) | Explain the key phases of the Software Development Life Cycle (SDLC) and discuss why documentation is essential across all development phases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | [4]           | CO 1 |
|    | b) | Differentiate between Functional Requirements (FRs) and Non-Functional Requirements (NFRs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | [2]           |      |
|    | c) | A healthcare organization is building a Mobile Patient Health Portal. Apply your knowledge of requirements classification to construct two Functional Requirements and two Non-Functional Requirements for this platform, ensuring each written statement is verifiable and unambiguous                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | [3]           |      |
| 2. |    | <p>OmniCart is an online shopping platform running on a single, large codebase (a monolithic Java application) that handles <u>orders</u>, <u>inventory</u>, <u>users</u>, and <u>payments</u> all together. During big sales events, the application frequently crashes. The chief architect found that when the inventory module <u>updates stock levels</u>, it directly <u>changes global variables</u> that belong to the payment module. To fix these performance and reliability issues, the team wants to modularize the system and is considering moving to a microservices architecture.</p> <ol style="list-style-type: none"> <li>Based on the scenario, identify the current type of coupling and cohesion present in OmniCart's codebase.</li> <li>Explain two major software engineering risks caused by this current setup.</li> <li>Propose how the engineering team can refactor the code to achieve Functional Cohesion and Data Coupling.</li> <li>Compare a Layered Architecture with a Microservices Architecture for OmniCart in</li> </ol> | [5x2<br>= 10] | CO 2 |

|    |    |                                                                                                                                                                                                                                                                                                                                                                     |     |      |
|----|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|------|
|    |    | <p>terms of system maintainability versus performance.</p> <p>v. Using the ATAM (Architecture Tradeoff Analysis Method) framework, identify and briefly explain:</p> <ul style="list-style-type: none"> <li>■ One Sensitivity Point</li> <li>■ One Trade-off Point</li> </ul>                                                                                       |     |      |
| 3. | a) | Explain the Single Responsibility Principle (SRP) and the Open/Closed Principle (OCP) in low-level object-oriented design.                                                                                                                                                                                                                                          | [2] | CO 3 |
|    | b) | A developer has built an InvoiceManager class that calculates tax formulas, prints invoice PDF layouts, and saves records directly to a database. Explain why this design violates SRP. Show how to refactor this structure into separate classes.                                                                                                                  | [4] |      |
|    | c) | Define Code Refactoring and state its fundamental rule regarding external system behavior                                                                                                                                                                                                                                                                           | [2] |      |
|    | d) | Explain how Docker containerization solves the "works on my machine" deployment issue                                                                                                                                                                                                                                                                               | [2] |      |
| 4. | a) | Analyze how neglecting Preventive Maintenance leads to structural degradation under Lehman's <i>Law of Increasing Complexity</i> . Relate this degradation to the "Software Cost Iceberg" concept, where 60% to 80% of total lifecycle costs reside below the waterline                                                                                             | [4] | CO 4 |
|    | b) | Contrast Verification ("Are we building it right?") with Validation ("Are we building the right thing?")                                                                                                                                                                                                                                                            | [2] |      |
|    | c) | <p>Analyze the following conditional code structure and calculate its Cyclomatic Complexity using Thomas McCabe's decision formula <math>V(G)=D+1</math></p> <pre> void processTransaction(int amount, bool isVerified) {     if (amount &gt; 5000 &amp;&amp; isVerified == true) {         flagHighValue();     } else {         standardProcess();     } } </pre> | [4] |      |
